

WHAT IS CLAIMED IS:

1. An electronic apparatus comprising:

a body;

a display unit provided on the body;

5 a fuel cell unit having a fuel cell capable of
supplying electric power to the body and a tank for the
fuel cell;

a sensing unit configured to sense a remaining
amount of fuel in the tank; and

10 a control unit configured to cause the display
unit to display the remaining amount of fuel sensed by
the sensing unit.

2. The electronic apparatus according to claim 1,
wherein the control unit causes the display unit to
15 display information to prompt a replacement of the tank
or information that the remaining amount has decreased
below a predetermined value, when the remaining amount
of fuel sensed by the sensing unit has decreased below
the predetermined value.

20 3. An electronic apparatus comprising:

a body;

a display unit provided on the body;

a fuel cell unit having a fuel cell capable of
supplying electric power to the body and an
25 installation portion in which a tank for the fuel cell
can be installed;

a sensing unit configured to sense whether or not

the tank has been installed in the installation
portion; and

5 a control unit configured to cause the display
unit to display information to prompt an installation
of the tank or information that the fuel cell has not
been installed, when the sensing unit has sensed that
the tank has not been installed.

4. An electronic apparatus comprising:
a body;
10 a display unit provided on the body;
a fuel cell unit having a fuel cell capable of
supplying electric power to the body and in and from
which a tank for the fuel cell can be installed and
removed;
15 a sensing unit configured to sense whether or not
an abnormality has occurred in the fuel cell unit; and
a control unit configured to cause the display
unit to display information of the occurrence of an
abnormality, when the sensing unit has sensed that an
20 abnormality has occurred in the fuel cell unit.

5. The electronic apparatus according to claim 4,
further comprising an abnormality processing unit
configured to carry out a process corresponding to the
abnormality.

25 6. The electronic apparatus according to claim 5,
wherein the control unit causes the display unit to
display information that the body is to be shut down

when a predetermined abnormality has occurred in the fuel cell, and

the abnormality processing unit shuts down the body after a predetermined time has elapsed since the display of information by the control unit.

7. The electronic apparatus according to claim 4, wherein the fuel cell unit includes a storage portion which stores status information indicating at least one of the presence or absence of the installation of the tank, the remaining amount of fuel in the tank, and the presence or absence of the occurrence of an abnormality in the fuel cell unit.

8. The electronic apparatus according to claim 7, further comprising an informing unit configured to inform the sensing unit of the storage of the status information, when the status information has been stored in the storage portion, wherein

the sensing unit reads the status information stored in the storage portion, when being informed by the informing unit.

9. The electronic apparatus according to claim 7, wherein the sensing unit reads the status information stored in the storage portion, at predetermined intervals of time.

10. The electronic apparatus according to claim 7, wherein the fuel cell unit has updating portion which updates the status information stored in the storage

portion so as to indicate that the remaining amount of fuel is a predetermined amount, when the tank has been removed or when the remaining amount of fuel in the tank has been reduced to zero.

5 11. A computer comprising:

 a body;

 a display unit provided on the body;

 a fuel cell unit having a fuel cell capable of supplying electric power to the body and in and from
10 which a tank for the fuel cell can be installed and removed;

 a storage unit provided in the fuel cell unit and configured to store abnormal-status information indicating an occurrence of an abnormality, when the
15 abnormality has occurred in the fuel cell unit; and

 a control unit configured to cause the display unit to display the occurrence of an abnormality on the basis of the abnormality information stored in the storage unit.

20 12. The computer according to claim 11, wherein the abnormal-status information indicates at least either the uninstallation of the tank or fuel shortage due to the decrease of the remaining amount of fuel in the tank below a predetermined value.

25 13. The computer according to claim 11, wherein the fuel cell unit includes an informing unit configured to inform the control unit of the storage of

the abnormal-status information, when the abnormal-status information has been stored in the storage unit, and

the control unit reads the abnormal-status information stored in the storage unit when being informed by the informing section, and causes the display unit to display the occurrence of the abnormality on the basis of the abnormal-status information read out.

10 14. A computer comprising:

 a computer body;

 a fuel cell unit having a fuel cell capable of supplying electric power to the computer body and in and from which a tank for the fuel cell can be installed and removed;

 a remaining-amount acquiring unit configured to acquire the remaining amount of fuel in the tank; and

 a remaining-amount control unit configured to inform an operating system run on the computer body of the value obtained by subtracting a predetermined value from the remaining amount acquired by the remaining-amount acquiring unit.

 15. A fuel cell unit comprising:

 a fuel cell;

 a detachable tank for the fuel cell;

 a storage unit configured to store information indicating the remaining amount of fuel in the tank;

and

an updating unit configured to update the
information stored in the storage unit so as to
indicate that the remaining amount of fuel in the tank
5 is a predetermined amount, when the tank has been
removed.

16. A state display control method for an
electronic apparatus capable of operating on electric
power supplied from a fuel cell unit which has a fuel
10 cell and in and from which a tank can be installed and
removed, the method comprising:

acquiring the remaining amount of fuel in the tank
installed in the fuel cell unit;

informing an operating system run on the
15 electronic apparatus of the value obtained by
subtracting a first predetermined value from the
remaining amount acquired; and

displaying information to prompt the replacement
of the tank, when the value obtained by subtracting the
20 first predetermined value from the remaining amount is
smaller than a second predetermined value.

17. A state display control method for an
electronic apparatus capable of operating on electric
power supplied from a fuel cell unit which has a fuel
25 cell and in and from which a tank can be installed and
removed, the method comprising:

sensing the removal of the tank from the fuel cell

unit;

displaying information to prompt the installation of the tank, when the removal of the tank has been sensed; and

- 5 informing an operating system run on the electronic apparatus that the remaining amount of fuel is a predetermined amount, when the removal of the tank has been sensed.
